### **HYDRAULIC PAVING VIBRATOR DELIVERS HIGHEST FORCE AT LOWER SPEEDS**

Wyco's hydraulic concrete vibrator is designed to meet industries requirements for air void standards and efficient paver operations. Wyco's exclusive hydraulic gear motor is proven to maintain reliable operating speeds throughout the life of the vibrator. The light weight compact single isolator bracket features Wyco's new claw clamp, which is easy to mount and the single isolator design eliminates the problem of concrete build-up, offering better performance, reduced maintenance and directs the vibration away from the paving machine and into the mix. The high impact rotor offers the highest force available and delivers an effective operating range for today's paving mix designs. The patented Square Head™ provides faster compaction, which improves paver speed with reduced risk of vibrator trails.

Wyco works closely with contractors and specifying agencies to develop products to meet today's pavement placement standards. Wyco also introduced the smart vibrator system, a PC application for continuous vibrator monitoring on hydraulic pavers. It provides a user-friendly touch screen graphic display of current speeds for each vibrator with high and low alarm speed settings; date, time, station track speed, air temp, air relative humidity an other sensor data; and it's easy to download to a variety of spreadsheet programs.
